

GroAurum

Customer Order Timeline v1

Wholesale order lifecycle from confirmation to delivery

Generated: July 16, 2026

Aligned with Home / Restock / Review Order v1 · Phase 3 adapters (af9e616)

This is NOT a consumer rider-tracking screen. Retailers follow warehouse and route fulfilment stages for a confirmed wholesale order.

1. Purpose

Show the complete lifecycle of a wholesale order from confirmation to delivery. Opened after Confirm Order on Review Order, or from the Orders list via /order/[id].

2. Design Principles

- Professional B2B, calm hierarchy, timeline-based
- GroAurum Design System and 8px spacing grid
- No marketing banners, coupons, or wallet
- Home, Restock, and Review Order screens were not redesigned

3. Timeline States

Stage	Explanation
Order Confirmed	Wholesale order confirmed and locked for fulfilment
Stock Reserved	Inventory reserved against this order
Packing	Warehouse packing SKUs to the packing list
Ready for Dispatch	Packed and waiting for route assignment
Assigned to Route	Assigned to a delivery route for the shop area
Out for Delivery	On the delivery vehicle to the shop
Delivered	Delivered to the shop

Each stage shows status, timestamp when available, and a short explanation. Upcoming stages show Pending until reached.

4. Screen Sections

- Header - order id, current status, confirmation time
- Timeline - seven-stage wholesale fulfilment rail
- Shop summary - shop, delivery window, sales executive, warehouse
- Order items - SKU lines with qty, unit price, line total
- Payment summary - subtotal, fees, total, method, payment status
- Delivery information - address label, text, scheduled window
- Notes - optional retailer notes from Review Order
- Repeat Order CTA - opens Restock for a new draft

5. Repeat Order

Repeat Order does not reopen the historical order. It navigates to the Restock tab so the retailer builds a new draft through the Restock flow.

```
router.push('/(tabs)/restock')
```

6. Mock Lifecycle

- createOrder starts at CONFIRMED with statusHistory stamped
- Simulator advances through all seven stages (~2.8s each)
- Each transition appends a timestamped statusHistory event
- Restock seed order is DELIVERED with a completed history
- Review Order notes, shop name, sales executive, and schedule are stored on the order

7. Files

- apps/customer/app/order/[id].tsx - Order Timeline v1 screen
- apps/customer/components/order-timeline/* - header, rail, sections, CTA
- apps/customer/services/order-timeline.ts - stages, labels, builders
- apps/customer/services/mock/orders.ts - B2B status flow + history
- apps/customer/types/index.ts - expanded OrderStatus + statusHistory
- apps/customer/app/_layout.tsx - stack title Order
- apps/customer/app/cart.tsx - passes notes/shop fields into createOrder

8. Status Mapping

Customer UI OrderStatus aligns to the wholesale timeline (not legacy PLACED / PACKING / OUT_FOR_DELIVERY only):

CONFIRMED
 STOCK_RESERVED
 PACKING
 READY_FOR_DISPATCH
 ASSIGNED_TO_ROUTE
 OUT_FOR_DELIVERY
 DELIVERED

9. Validation

Check	Result
Customer app typecheck (tsc --noEmit)	Pass
Home / Restock / Review Order layouts	Unchanged
Rider progress UI	Removed from order detail

10. How to Review

```

pnpm dev:customer
# Review Order -> Confirm Order
# Opens /order/[id] Order Timeline
# Or Orders tab -> select an order
# Repeat Order -> Restock tab
  
```

11. Out of Scope

- Live map / rider GPS tracking
- Supabase order placement and live status events
- Payment gateway settlement
- Home / Restock / Review Order visual redesign

12. Intent

Order Timeline should feel like a calm B2B fulfilment record: confirmation, stock, packing, dispatch, route, delivery - not a Blinkit-style live rider chase.
