## Customer Restock Screen v1

Reorder inventory in under one minute for professional retailers  
Generated: July 16, 2026  
Consistent with Home Screen v1 / Phase 3 adapters (af9e616)

*Calm B2B restock flow: prior order history drives suggestions; SKU MOQ and quantityStep control steppers. No promotional banners, coupons, wallet, or gaming UI.*

## 1. Purpose

---

Help retailers reorder inventory in under one minute. Suggested products come from what the shop previously ordered. Quantities follow each SKU's own commercial configuration - not hard-coded carton/KG business rules in the UI.

## 2. Design Principles

---

- Professional B2B, minimal distractions, calm hierarchy
- GroAurum green branding retained
- 8px spacing grid
- No promotional banners, coupons, wallet, or gaming UI
- Visual language consistent with Home Screen v1

## 3. Screen Layout

---

- Header - Restock title + shop context
- Restock summary card - SKU count + suggested units
- Estimated order value - updates live with steppers
- Suggested products list
- Quantity steppers that follow SKU MOQ / quantityStep
- Add more products - navigates to Search
- Sticky Review order bar - merges draft into cart

## 4. Suggested Product Row

---

| Field                      | Source                               |
|----------------------------|--------------------------------------|
| Product image              | Catalogue product mark               |
| Product name               | Catalogue                            |
| Grade / specification      | SKU commercial fields                |
| Last ordered quantity      | Most recent order history line       |
| Suggested quantity         | Last qty normalized via SKU MOQ/step |
| Trade price + selling unit | Current catalogue price / unit       |
| Stock status               | In stock / Low / Out of stock        |
| Quantity stepper           | stepSkuQuantity(product, qty, +/-1)  |

## 5. Quantity Rules

---

Do not hard-code business rules in the Restock UI. Carton and KG SKUs both use the same helpers driven by each product's moq and quantityStep:

```
normalizeSkuQuantity(product, requestedQty)
stepSkuQuantity(product, currentQty, +1 | -1)
```

# Examples (from SKU config, not UI conditionals):

# KG moq=10 step=10 -> 0, 10, 20, ...

# CARTON moq=1 step=1 -> 0, 1, 2, ...

## 6. Empty State

---

If no order history exists (or no matching in-stock SKUs remain), Restock shows an empty state encouraging the retailer to browse the catalogue. Supabase mode never invents purchase history.

Mock adapter only: when history is empty, Restock may seed one prior delivered order from catalogue SKUs (qty = each SKU's own MOQ) so the screen is demoable without forcing a full checkout first.

## 7. Review Order Flow

---

- Retailer adjusts suggested quantities
- Estimated value and unit count update immediately
- Review order clears cart, adds selected restock lines, opens Cart
- Sticky bar is the only floating CTA (same pattern as Home)

## 8. Navigation

---

- New Restock tab in customer bottom navigation
- Home last-order card can deep-link into Restock for seeded/demo history
- Add more products opens Search

## 9. Files Added / Updated

---

- apps/customer/app/(tabs)/restock.tsx - Restock screen
- apps/customer/app/(tabs)/\_layout.tsx - Restock tab
- apps/customer/services/restock.ts - history + suggestion plan
- apps/customer/components/restock/\* - summary, value, row, review bar
- apps/customer/utls/product-b2b.ts - normalize/step SKU quantity helpers
- apps/customer/services/mock/orders.ts - seedMockDeliveredOrder (mock only)
- apps/customer/types/index.ts - RestockSuggestion type

## 10. Validation

---

| Check                                      | Result                                |
|--------------------------------------------|---------------------------------------|
| pnpm --filter @groaurum/customer typecheck | Pass                                  |
| pnpm --filter @groaurum/customer lint      | Pass                                  |
| Mock Restock tab                           | Suggestions + steppers + Review order |
| Empty history (Supabase / no orders)       | Browse catalogue empty state          |

## 11. How to Review

---

```
pnpm dev:customer
# mock adapter (default)
# pick a location, open Restock tab
```

## 12. Out of Scope

---

- ML / demand forecasting beyond last-ordered qty
- Supabase-backed order history reads (still mock orders store)
- Assisted-order OTP, payments, or TradeFlow redesign
- Sales / Delivery / Admin apps

## 13. Intent

---

Restock should feel like a wholesale reorder checklist: previous purchases, valid SKU steps, clear trade value, and a single path to Review order - not a consumer promotion feed.
