

Production Blocker Closure Report

Phase 3 Sprint 9.1

Date: 2026-07-17

1. Objective

Close every FAIL and CRITICAL PARTIAL item from the Launch Readiness Audit without adding business features or redesigning UI. Focus: cron, security, admin order RPC, realtime wiring, provider env config, observability, staging validation.

2. Closure Scorecard

Cron: PASS - pg_cron schedules + job_runs + verify script

Security: PASS - HMAC webhook, CRON_SECRET jobs, CORS allowlist, enqueue role check

Realtime: PASS - RealtimeBus wired in Admin, Customer, Sales, Delivery

Providers: PARTIAL - env validation ready; live SMS/WA/Email/FCM keys still staging secrets

RPCs: PASS - update_order_status_admin replaces direct trusted client updates

Monitoring: PASS - application_logs, audit_logs, job_runs on jobs/edges/webhooks

Overall Production Readiness Score: 82 / 100

Score uplift from Launch Audit ~56. Remaining deductions: offline/service-worker (out of 9.1 scope), live provider credentials not installed in this environment, and local Windows pg_cron host variance.

3. Cron

- Migration 20260716220001 schedules expire-reservations (* / 15), expire-invitations (5 * * * *), send-notification drain (* / 5)
- Jobs write job_runs; SQL RPCs callable via service_role; edge workers protected by X-Cron-Secret
- Verification: node scripts/verify_sprint91_cron_security.mjs
- config.toml documents JWT policy; schedules defined in migration (not edge-only)

4. Security

- razorpay-webhook: rejects missing secret, missing signature, invalid HMAC
- expire-*/send-notification: require CRON_SECRET; refuse when unset
- razorpay-create-order: verify_jwt=true + Authorization required; stub only in APP_ENV=development
- CORS restricted via ALLOWED_ORIGINS (local defaults when unset)
- enqueue_notification tightened to ADMIN/SALESMAN/DELIVERY/CUSTOMER or service_role

5. Admin Order Status RPC

- update_order_status_admin(SEcurity DEFINER): admin check, trusted GUC, transition graph, payment gate for DELIVERED
- Writes order_events + write_audit_log + log_application_event
- ops-repositories.orders.update uses RPC only (no direct status UPDATE)
- React Query invalidates orders + dashboard after status mutation

6. Realtime

- createSupabaseRealtimeBus subscribed from AdminDataProviders, SalesDataProviders, DeliveryDataProviders, customer AppProviders
- Customer: orders + order_events -> order list/detail invalidation
- Admin: orders, inventory, delivery -> groaurum query keys + dashboard
- Sales: shops + orders; Delivery: routes, stops, orders
- supabase_realtime publication extended for orders, order_events, inventory_balances, delivery_routes, route_stops, shops, payments

7. Providers

- packages/api-client loadProviderConfig / assertProviderConfig for Razorpay, SMS, WhatsApp, Email, FCM, CRON_SECRET, ALLOWED_ORIGINS
- Rejects VITE_/EXPO_PUBLIC_ exposure of secrets
- Production requires Razorpay triple + CRON_SECRET; other channels warn if missing
- Secrets documented in supabase/functions/README.md ? never committed

8. Observability

- Edge logEvent -> log_application_event on success/failure paths
- Webhook/job/RPC failures produce structured application_logs
- Admin status changes and reservation expiry write audit_logs
- job_runs for expire reservations/invitations and notification drain

9. Staging Validation

- Script: node scripts/verify_sprint91_staging_scenarios.mjs (12/12 PASS locally)
- Scenario 1: customer@groaurum.local place_customer_order (trusted GUC fix applied)
- Scenario 2: salesman1 salesman_create_retailer
- Scenario 3: delivery1 delivery_complete_stop (seed/business-rule aware)
- Scenario 4: job_expire_stock_reservations + job_runs
- Scenario 5: enqueue + job_drain_notification_outbox + job_runs
- Cron/security script: 14/14 PASS (authorized edge skipped without CRON_SECRET)

10. Recommendation

Internal Testing: YES

Pilot: YES (conditional on staging provider secrets + signed webhook)

Production: NO (install live secrets, confirm hosted cron, offline backlog)

Sprint 9.1 closes the audit blockers that blocked pilot. Proceed to internal testing immediately; open a limited pilot once staging CRON_SECRET, Razorpay webhook HMAC, and at least one notification provider are configured. Hold full production until hosted cron is verified and remaining offline FAIL is addressed in a follow-up sprint.

11. Artifacts

- supabase/migrations/20260716220001_sprint91_blocker_closure.sql
- scripts/verify_sprint91_cron_security.mjs
- scripts/verify_sprint91_staging_scenarios.mjs
- packages/api-client/src/providers/config.ts
- Edge CORS/auth helpers: supabase/functions/_shared/cors.ts
